I have been focusing more on the scripting language that is python and machine learning and comfortable with advanced level concepts in those areas. When it comes to the frontend development, I have a basic knowledge about the html to build a website and apply CSS to make them look clean and responsive, JavaScript to create simple functionality on web pages. Though front-end development is not my main strength, I enjoy learning how it all connects, and I had learned this basic knowledge from my last trimester. Through this unit, I will be improving my web development skills and getting more knowledge about the JavaScript. My aim is to achieve a Distinction or a credit task by staying consistent with my efforts and completing all tasks.
